OBJECTIVE

Aspiring Red Team operator with hands-on penetration testing experience, aiming to advance from pentester to Red Team roles to execute adversary emulations and strengthen security posture.

EDUCATION

Bachelor of Information Security

Sep 2022 – Present

University of Information Technology - VNUHCM

SKILLS

Technical Skills:

- Knowledge: OWASP TOP 10 Vulnerabilities, MITRE ATT&CK, Cryptography, Steganography, Security Protocols, Network, SSDLC.
- Tools: BurpSuite, Metasploit, Nmap, Wireshark, Hydra, Apktool, gdb, Gobuster, Nikto.
- Languages: Python, C++, C#, JavaScript.
- Pentest Skills: Hands-on experience with PortSwigger Web Security Academy and HackTheBox labs, focusing on Website, Network, and System penetration testing.

Soft Skills:

- Strong teamwork and adaptability, effective public speaking, and fluent English communication.

EXPERIENCE

NAB INNOVATION CENTRE VIETNAM

Ho Chi Minh City

StarCamp Batch 18 - Attack Surface Management

11/2025 – Present

- Completed NAB internal CISSP training program, strengthening knowledge across core security domains (risk management, governance, IAM, and security operations).
- Triageed and validated security vulnerability submissions on Bugcrowd (NAB-hosted program), following internal workflows for reproduction, severity assessment, and stakeholder coordination.
- Developed Attack Surface Management tooling, including automated asset discovery, reconnaissance, and scanning workflows to identify external exposures and security risks.

LIEN PHAT TECHNOLOGY CORPORATION

Ho Chi Minh City

Intern Penetration Testing

8/2025 – 10/2025

- Researched and analyzed security vulnerabilities in software and network protocols.
- Developed offensive tools (reconnaissance, scanning, and Automation scripts) to support penetration testing and simulated attack scenarios.
- Discovered and investigated 0-day vulnerabilities; performed CVE research and risk assessments.
- Prepared detailed technical reports and remediation recommendations; collaborated with development teams to verify fixes.

INFORMATION SECURITY LABORATORY (INSECLAB)

Ho Chi Minh City

Member of TeamQ - Researcher

2023 – Present

- Developing websites and machine learning models to detect phishing websites, scam calls, fraudulent emails, and scam phone numbers.
- Researching software security and contributing to international conference articles.
- Participating in cybersecurity competitions like Data Science Challenge, Youth Digital Citizen Challenge 2024, Eureka 2024, HDBank Hackathon 2025.
- CTF (Capture The Flag) Competitions: Participated in various CTFs, focused on Web Penetration Testing, Cryptography, OSINT and Web LLM attacks.

Phishing Website Detection via Multimodal Learning and Retrieval-Augmented Reasoning

PROJECTS

2025 RIVF International Conference

June 2025 – April 2025

Phishing Website Detection via Multimodal Learning and Retrieval-Augmented Reasoning

Developed a multimodal phishing detection framework using RAG as the core defense, integrating URLs, structured features, and HTML. Proposed a Selective Cross-Attention Fusion mechanism that applies RAG only to semantically rich modalities, achieving F1-score 99.70% and reducing ASR to 12.77% on 4,000 adversarial samples.

- Team Size: 2 members
- Responsibilities: Built a Multimodal Deep Learning model combining raw URL processing (Transformer/BERT), structured features (DNN), and HTML content (BERT). Designed and implemented the RAG module, fine-tuned Foundation-Sec-8B LLM with prompting strategies for final classification and explainable reasoning.
- Technologies: RAG, LLMs, Machine Learning, GAN-based Adversarial, Python.

Website Malware & Ransomware Detection using Machine Learning

Mar 2025 – June 2025

Developed a model to detect Android ransomware using static features from APKs (permissions, intents, API calls).

- Team Size: 3 members
- Responsibilities: Fine-tuned PLMs for ransomware detection (99%+ accuracy, perfect recall) and deployed a web tool for malware detecting using APK features. .
- Technologies: Apktool, Python, Transformers, SHAP, LIME, Flask.

Apollon: Robust IDS against Adversarial Machine Learning Attacks

Mar 2025 - June 2025

Developed an adaptive IDS using Multi-Armed Bands (MAB) to select optimal classifiers for network traffic in real time.

- Team Size: 4 members
- Responsibilities: Built two GAN-based attack models (RELEVAGAN and Traffic Manipulator) to generate adversarial network flows to test the robustness of the IDS.
- Technologies: Python, Scikit-learn, MABLib, Wireshark, CICFlowMeter, GAN-based Adversarial.
